Sierra Products P/L have a range of natural gas or LPG Radiant Cone Heaters that can heat quite large open areas, they have been designed to simulate the radiant warmth of the sun, spreading heat evenly over a broad area. Using radiant heat ensures the working area is properly heated with a minimal heat loss through the roof.

On the Sierra Radiant Cone Heaters, the combination of the shallow profile reflector precisely matched with the cone shaped emitter ensures maximum efficiency and an even heat distribution. Secondary heating from walls, floors and equipment adds to the effect. The result is the most cost effective form of gas heating for a wide range of industrial and commercial premises.

Some important features to note are:

- Saving of 50% of fuel costs of blown warm air system.
- Savings of 27% on fuel cost of radiant tube heater systems.
- Outstanding safety features.
- Thermostatically controlled.
- Individual bank wiring achievable.
- Each re-ignites when temperature drops below one degree Celsius of the setting.
- Automatic ignition system means that is used only when the heater operates.
- No permanent pilot light flame.
- Full fail safe device.

The largest in our range of heaters, the 1500 can be mounted approximately 6.5 meters off the floor and can heat an area of up to 140m², in a well insulated building of modern construction, with limited air changes.

Some examples of where the heaters have been installed are:

- Factories and Warehouses
- Night clubs
- Print shops and other stores.
- Churches
- Halls
- Restaurants (outdoor patios)
- Child care centers
- Wineries
- Hotels and reception
- RSL
- Museums
- Motor dealerships.
